Section: Leadership

Task 4: Our top management demonstrates leadership and commitment to continual improvement of energy performance and the effectiveness of the energy management system.

Getting It Done

1. Optionally, identify business drivers and benefits applicable to your organization.
2. Optionally, prepare and deliver a briefing to top management on the identified business drivers and benefits, management roles and responsibilities, and how these responsibilities will be met.
3. Secure commitment from top management to continual improvement of energy performance and the development and use of a 50001 Ready system.
4. Brief top management on their energy management system (EnMS) leadership responsibilities.
5. Plan for how top management will meet their responsibilities.

Task Overview

A critical key to the success of an energy management system (EnMS) is involvement and commitment by top management. This does not mean top management needs to be at energy team meetings and approve all decisions but they need to provide honest, constant, and visible commitment to the concept and implementation of the EnMS. In addition to providing the leadership needed to improve energy performance and the EnMS, top management must demonstrate that they perform the specific responsibilities assigned to them within the continual improvement framework of the EnMS. Not only does top management approve and authorize an EnMS, they are also responsible and accountable for ensuring its ongoing suitability, adequacy, and effectiveness.

This guidance is relevant to Section 5.1 of the ISO 50001:2018 standard.

Full Description

Identify EnMS benefits and business drivers

Many organizations pursue energy optimization and energy conservation, because they are valued as the “right thing to do”; However, impacts to the bottom line and prospects for long-term viability are most often the determinants of proposed organizational initiatives, including those for energy management. The benefits of improved energy management and energy performance should be identified and

communicated to top management in terms they understand. Consequently, making the business case is an important part of establishing an energy management system (EnMS).

As ISO 50001 gains traction in the global marketplace, implementation case studies and other analyses are reporting the benefits of this systematic approach to energy management. These benefits include:

- Improved operational efficiencies
- Decreased energy intensity
- Energy data for informed evidence-based decision making
- Support for organizational and cultural change
- Drivers for organizational integration
- Reduced environmental impacts
- Competitive advantages over firms that neglect resource management
- Visible demonstration of social responsibility

Learn about the benefits that other organizations have experienced with their EnMS. Search the web for general examples and case studies, as well as those related specifically to your own industry.

Consider the potential benefits of an EnMS within the context of your organization's priorities and needs. To build the business case you must connect the benefits of the EnMS with the business drivers of your organization because management will want to know how the EnMS and improved energy performance affect those drivers.

Energy team members (see Task 6 Energy Team and Resources) should identify the business drivers relevant to your organization. Then work to ensure management understands the benefits by presenting information in terms that are important to them. If the energy team members have not been designated, then identify someone willing to champion the initiative and accept this responsibility.

Learn More: **Social business drivers**

Social pressures can be as daunting as financial and legal issues for an organization. An EnMS can help address social issues as well as provide evidence of an organization's efforts to do so. Many public concerns are related to environmental issues, but there are others that are important. Some of these may include:

- Alternative energy (e.g., solar, wind, thermal, hydro, nuclear, biomass)
- Natural resource depletion
- Environmental stewardship
- Energy conservation
- Energy waste
- Ethics, values, principles
- Triple bottom line

Pressures can be exerted by government entities, local communities, trade associations, environmental groups, and employees, just to name a few. An organization should identify the

relevant issues and use their management system processes to minimize negative impacts and communicate the positive efforts being made to address them.

Learn More: **External business drivers**

External drivers are typically outside the organization's control. There are many external groups or stakeholders that could have an interest in the organization's energy activities and help drive its direction. Their interest could be reflected through financial, legal, or social drivers. The external groups that have or can have an impact on the organization can be identified, and appropriate procedures and communication channels can be implemented to address the needs and interests of these groups relative to energy use and optimization. An EnMS can help companies address these needs and interests.

Some of the influencing groups could be the following:

Stockholders: Obviously, stockholders are interested in the profitability of the organization and in measures that reduce costs. They are also interested in the business operating legally and addressing relevant social issues, and they expect to be provided a measure of assurance of the business' long-term viability.

Lenders: Lenders want their money back with interest. An EnMS is a tool for the organization to address continual improvement, thereby improving profits and efficiencies and enhancing long-term existence.

Customers: Customers want the best return for their dollar. Reducing costs and improving efficiencies allow products and services to be offered at the lowest price with less waste, thus providing the best value to the customer and improving the organization's competitiveness. The continual improvement component of an EnMS can help an organization improve efficiencies and reduce costs.

Suppliers: An efficient supply chain is important to competitiveness. An important component of supplier selection and maintenance is a commitment to continual improvement, including energy optimization. An EnMS can help with supplier selection. The presence of an EnMS would be one indication of a supplier's commitment to energy performance improvement.

Public: The public in general, as well as many public groups, can be drivers for an organization's operation. Public utilities can impose requirements that must be addressed. An EnMS can help an organization address these issues and provide evidence of its efforts. Examples of public interested parties are:

- Neighbors
- Community
- Utilities
- Schools

- Environmental Groups
- Trade Associations
- Development organizations

Government: An EnMS can help an organization address existing regulations and plan for future government regulations. It provides the system to help the organization identify and address relevant government codes and laws. Some examples of governmental interested parties are national, regional, and local government agencies, especially those related to energy or the environment.

Learn More: **Internal business drivers**

There are also internal business drivers that affect an organization's strategy and drive its business needs. Internal drivers are generally controlled by the organization and reflect the need of an internal stakeholder, but can be a response to an external driver. These drivers are identified to address internal needs and interests relative to energy use and efficiency.

Relevant internal drivers can include the following:

Employee satisfaction: Employees want to do a good job and operate in a good working environment. Improving energy optimization makes the process more efficient and can result in an improved operating environment by reducing heat, exhaust, and waste levels.

Productivity: As operations are improved and less energy is required, employees become more productive. Productivity is output over input; as output increases or input decreases, productivity is improved. An improved working environment promotes higher employee morale, increased output relative to input, and improved operational control. Examples of energy efficiency changes that can result in improved productivity include the following:

- Efficient energy procurement practices
- Improved capacity utilization
- Process and equipment efficiency improvement
- Fuel burning and utility equipment efficiency improvement
- Combined heat and power
- Waste heat recovery
- Automated control systems
- Monitoring equipment improvement
- Reduced backup with better reliability
- Improved employee environment

Technology: Advanced technologies are typically more energy efficient and may improve a process or operation. In addition to improving performance, advanced technologies can also result in improved operational flexibility and better control.

Maintenance: Regular maintenance is critical to maintaining equipment operating efficiency, which results in peak performance. It also promotes improved reliability, better schedule adherence, better utilization, and extended equipment life.

Organization development goals: Strategic goals by the organization to be the best, the first, the most efficient, the biggest producer, etc. drive the organization to include energy efficiency as a component of their management system. Financial, legal, and social drivers all play into organizational goals, and the role of improving energy performance plays in addressing those drivers should be addressed.

Identify the relevant internal drivers and determine how they interface with the organization's energy management and energy performance. Use this information to support the business case for EnMS implementation.

Learn More: **Key internal influencers**

As part of preparing the business case, consider identifying "key internal influencers"; within your organization. Internal influencers are individuals who do or could have interest or influence on decisions related to energy. To gain support for the development and operation of the EnMS, it can be helpful to identify these individuals from among management and employees. Identify how energy is important to them and what would encourage their support and participation. Each may have a different motivation; for example:

- a Building Manager or Production Manager's primary focus may be energy availability.
- a Purchasing Manager's primary focus may be energy cost.
- a Maintenance Manager's primary focus may be energy quality and availability.
- an Environmental Manager's primary focus may be environmental impacts, such as pollution, from energy consumption.

Ensure that the needs of the internal influencers related to energy use (i.e., application of energy) and energy consumption (i.e., quantity of energy applied) are understood and addressed within the business case. The Playbook worksheet illustrates how this information can be captured. A blank template is available in the Playbook worksheet for your optional use.

Prepare a briefing for top management

If management has not already committed to EnMS implementation, or if commitment is lacking, they will need to be convinced of the benefits so they can provide successful support.

Consider the following tips when preparing your briefing for top management:

- **The target audience is management.** What drivers are important to them? Management is typically most interested in the return on investment, but there may be other important drivers.

Focus on these, and make the presentation complete but brief. Management frequently just wants to hear the major facts. Have additional data available if more detail is requested, but if presentation timelines are provided, stick to them.

- **Focus on what you are trying to convey.** Present the background required to support the benefits of an EnMS, and don't mix in unrelated issues or ideas. Focus on the continual improvement-based nature of the management system and the direct impacts on the organization's well-being and improvement.
- **Present the benefits in management's terms.** Using the drivers already identified, present the benefits in terms of those drivers. Make sure management understands the benefits with respect to their key items of interest.
- **Understand the desired objective.** What is the expected result of this presentation? Provide information to encourage that result or offer suggestions.

An elevator speech (a short summary) can be used to get a point across quickly and simply. It should take no longer than two minutes to present. Use the Playbook worksheet to focus on the essential information, and then expand it to the time available. Regardless of the amount of time available, be sure to cover the important points at the beginning. To ensure that management hears what you want to share, an old adage is appropriate: "Tell them what you are going to tell them, then tell them, and then tell them what you told them."

Deliver briefing to top management

Develop a briefing for top management using the organization's standard presentation tools or in another format that best displays the information.

Stay within the time frame provided, and stick with the planned presentation. Be prepared to answer questions and provide more detail if requested.

Management may ask the following types of questions:

- What do we currently spend each year on energy?
- What are the estimated cost savings that potentially we could realize in one to two years?
- What will be the time commitment by the energy management team?
- What are the biggest challenges to implementing an ISO 50001 EnMS?
- What will you need from us (top management) to make this program successful?

The intent of the presentation is to briefly provide the information needed for management to make necessary decisions, and to provide additional details as required. If the topic begins to stray, put the presentation back on track by bringing the group's attention back to the presentation materials. The Playbook worksheet can help you stay on track. Adjust the agenda based on the time available.

Secure management commitment

Obtaining sincere top management support is a critical component of developing an energy management system that will be sustained. Consider the following questions:

- Is your top management on board?
- Have they assigned the responsibilities and authorities to implement an EnMS?
- Has top management approved and allocated the resources needed to successfully implement an EnMS?
- Once the EnMS is implemented, are they committed to the actions and resources needed for operating and maintaining it for the long term?
- Are they willing to continually improve energy management and energy performance as part of the organization's ongoing business strategy?

Top management commitment needs to be followed by a clear understanding of their responsibilities and appropriate actions. Top management must demonstrate its leadership and commitment. When top management is active and visible in the EnMS, employees and others perceive the value and importance of energy management and energy performance improvement to the organization. For example, simple actions from top management such as adding energy topics to meeting agendas and sending email updates on energy performance help to keep the whole organization involved.

Learn More: **Create a project plan**

A project plan that outlines the actions, schedule, and resources necessary to implement the EnMS can help garner management support because it clearly defines expectations for the effort. Consider creating a project planning for EnMS implementation using the approach outlined in the Playbook worksheet.

Top management must support the effort not just during initial EnMS implementation, but also after the system is implemented and operational. Management must take a number of actions that will demonstrate their commitment to continual improvement of energy performance and the EnMS. These actions are detailed below and in Task 3 Scope and Boundaries, Task 5 Energy Policy, Task 6 Energy Team and Resources, and Task 15 Awareness and Communication.

Brief top management on their EnMS leadership responsibilities

Once top management is committed to implementing the EnMS, make sure they understand what actions they must take in order to demonstrate their commitment to continual improvement of both energy performance and the EnMS. Per the requirements of ISO 50001, top management can delegate responsibility for many, but not all, actions.

While the 50001 Ready Navigator does not follow the exact requirements of ISO 50001, below is a list of actions the ISO standards says top management must act on directly:

- **Communicate** that effective energy management and following the requirements of the EnMS are important.
- **Promote** continual improvement of the EnMS and continual energy performance improvement.
- **Direct and support** contributions by personnel to energy performance improvement and the

effectiveness of the EnMS.
- **Support** other management in demonstrating their leadership in their areas of responsibility.

In addition, top management can either perform themselves or delegate (ensure) that:

- the scope and boundaries of the EnMS have been clearly defined.
- the energy policy and objectives and the energy targets align with the organization's strategic direction.
- requirements of the EnMS are integrated into the organization's business processes.
- action plans have approval and are implemented.
- needed EnMS resources are available.
- the intended outcomes of the EnMS are achieved.
- an energy management team is formed.
- Energy performance indicators (EnPIs) appropriately represent energy performance.
- there are processes to identify and address changes affecting the EnMS and energy performance.

Briefing top management on their EnMS leadership and commitment responsibilities is typically done by the leader or members of the energy team. An effective approach can be to schedule the briefing as part of an existing management meeting. Alternatively, the briefing could be part of an ISO 50001 training event that includes top management.

Plan for how top management will meet their responsibilities

One outcome of the briefing to top management should be a plan for how top management will meet their responsibilities during initial EnMS implementation. For example, in most initial EnMS implementations, the energy team develops proposed EnPIs and proposed objectives and energy targets. These are then reviewed and approved by top management before becoming a formal part of the EnMS. A project management best practice for the initial implementation is for project milestones to include submission of final work products (outputs) to top management for specific elements of the EnMS.

After initial implementation, a number of top management's delegated responsibilities can be demonstrated through the management review process. (see Task 23 Management Review).

Decarbonization

Successfully managing energy and energy-related GHG emissions requires the involvement and commitment of top management. In addition to understanding the benefits of improved energy management and energy performance, top management should understand why managing energy-related GHG emissions is important and why managing them through the EnMS is beneficial to the organization.

Even if top management already understands the importance of GHG management and potentially was the original driver behind your organization's interest in reducing energy-related GHG emissions, make sure to communicate the value of integrating the management of energy and energy-related GHG

emissions using an ISO 50001-based energy management system and why the organization is including energy-related GHG emissions within its energy management system. Be sure to emphasize the outcomes of Task 1 An EnMS and Your Organization which highlights the strategic internal or external issues that can be addressed by including energy-related GHGs within the energy management system, along with any voluntary or regulatory requirements identified in Task 2 People and Legal Requirements Affecting the EnMS. If completed, be sure to also emphasize the outcome of Task 7 Risks to EnMS Success which can help highlight the risks posed by not managing energy-related GHGs.

When meeting with top management, be prepared to answer GHG-related questions such as:

- Does adding energy-related GHG to the EnMS make it more complicated? Does it add risk now and in the future?
- What are the risks of not managing energy-GHG emissions?
- What are the costs of managing energy-related GHG emissions (e.g. data collection and monitoring, equipment, reporting)?
- How does managing energy-related GHG help the organization?
- What do we understand or know to be our current sources of energy-related GHG emissions? How much do those emissions cost (financial, environmental, etc.) the organization now and how much might they cost in the future?
- What does top management need to do to make the energy-related GHG and energy management program successful?

Establishing a new EnMS prioritizing decarbonization

If you do not have an existing 50001 Ready-based EnMS and want to build one that also helps your organization manage energy-related GHG emissions, you should follow the guidance in the “Full Description” tab keeping the following in mind:

1. **Identify EnMS benefits and business drivers**. Review the list of strategic internal and external issues identified in Task 1 An EnMS and Your Organization. Include a list of business drivers and benefits that make the case for managing energy-related GHG emissions and integrating them into the EnMS.
2. **Prepare and deliver a briefing for top management**. Integrate into the planned briefing to top management remarks on:
    a. Why energy-related GHG emissions are going to be managed.
    b. Why energy-related GHGs are being added to the energy management system.
    c. What, if any, changes will be required in top management’s responsibilities.
3. **Secure management commitment.** Ensure top management is willing to allocate the resources needed to implement the EnMS, including resources to reduce energy-related GHG emissions and to continue supporting the actions needed in the long term.
4. **Brief top management on their EnMS leadership responsibilities**. Once committed, top management must understand the actions they must take and ensure top management understands how energy-related GHG emissions are integrated into their responsibilities.
5. **Plan for how top management will meet their responsibilities**. Create a work plan for how top management will be involved in the creation and subsequent use of the EnMS, ensuring that energy-related GHG emissions are considered. For example, the energy team may choose to

develop energy and energy-related GHG emission indicators (EnPIs) and present them to top management for review and approval.

Adapting an existing EnMS to prioritize decarbonization

If you have an existing 50001 Ready-based EnMS and want to adapt it to manage energy-related GHG emissions, you should:

1. **Review EnMS benefits and business drivers**. Review the list of strategic internal and external issues identified in Task 1 An EnMS and Your Organization. Develop a list of business drivers and benefits that make the case for managing energy-related GHG emissions and integrating them into the EnMS.
2. **Prepare and deliver a briefing for top management to secure their commitment**. Prepare and deliver a briefing to top management that includes:
    a. Why energy-related GHG emissions are going to be managed.
    b. Why energy-related GHGs are being added to the EnMS.
    c. What, if any, changes will be required in top management's responsibilities.

    The intent of the briefing is to secure top management's commitment to include energy-related GHG emissions in the EnMS.

3. **Plan for how top management will meet their responsibilities**. Create a work plan for how top management will be involved as the energy team updates the EnMS to include energy-related GHG emissions (e.g., approval of updated documents such as the scope and boundary statement, energy policy, etc.) and how they will be involved in the subsequent use of the updated EnMS. Consider whether the energy team will present updated items individually for approval or as a combined package for top management to review.

Commercial ERP

The guidance for this task is from the following sections from the ERP Framework: ERP Framework Milestone 1.

The focus of this task is on ensuring top management commitment and leadership to the energy management system and the continual improvement of energy performance. When identifying stakeholders to engage, consider who will be needed to support the planning effort (e.g., property managers), who will be needed to approve the Emissions Reduction Plan (e.g., the CFO), and who will be expected to support plan implementation (e.g., project managers). It is also critical to ensure executive leadership is engaged and committed to the emissions reduction targets and the decarbonization pathway documented in the ERP. Leadership can ensure emissions reduction targets are met by clearly communicating their commitment to all levels of the organization. (Milestone 1)

Industrial ERP

Our top management demonstrates leadership and commitment to continual improvement of

energy performance and the effectiveness of the energy management system.

*Understanding and communicating to top management the energy **and environmental** business drivers of an energy management system can be vital to obtaining management commitment.*

The guidance for Task 4 is found within the following sections of the ERP Industrial Framework:

Milestone 1:

Executive leadership and finance teams can help provide clarity on decision making process and financial mechanisms and metrics required to assess the business case for decarbonization projects.

Setting ambitious GHG emissions targets may help increase support from senior management and secure funding for internal GHG reduction opportunities.

Milestone 5:

Secure final buy-in from stakeholders, and release plan – Share the draft ERP with all key stakeholders, update it to reflect their feedback, and get final approval from the steering committee and executive leadership. The approved ERP should be communicated by leadership throughout the organization.

Ongoing Implementation:

Organization leadership should regularly communicate implementation progress and status towards the goals.
